Project Report: Reflection on Cyber Safety (100–150 words)

While researching cybercrime for this project, I was most surprised by the psychological sophistication of **Social Engineering**. I previously believed that cybercrime was purely technical hacking, but I realized that most attackers simply exploit human emotions like urgency, fear, or the excitement of a "job offer" from a firm like **Deloitte**. Seeing how easily a "spoofed" website can look like an official university portal was a major eye-opener.

As a result, the one habit I will personally change is my approach to **UPI transactions**. I used to assume that scanning a QR code was always safe, but I will now be extremely vigilant about never entering my PIN unless I am the one intentionally making a payment. I have also committed to using a dedicated **Password Manager** to ensure that a leak on one platform does not compromise my entire digital identity, especially my academic and professional accounts.
